

Simplify your global infrastructure management with **Moaxy**.

Client

Griddable.io, now a Salesforce company provides a SaaS Platform for Synchronized Data Integration for enterprises. The Griddable.io concept was conceived with a vision to create a globally synchronized enterprise. It is based on a key decision to Build-on vs. Replace traditional databases and develop a new approach for synchronous data integration.

Context & Challenges

To help its customers with data synchronization and migration, Griddable.io needed a highly secure and available infrastructure that could handle interactions between a mixture of on-premise and hybrid clouds.

To add to the complexity Griddable needed to manage multiple locations spread across the globe.

This resulted in a number of challenges for the team including:

1. Lack of VPN end point for cloud.
2. Managing multiple systems like Cisco Firewall, Microsoft DLP, Multiple virus & Malware solutions.

Managing these multiple solutions was increasing the complexity for the Griddable team, not to mention the expense.

Summary

Griddable.io is a SaaS Platform for Synchronized Data Integration for enterprises. It was acquired by Salesforce in 2019.

They needed to implement a simple solution to manage their Global on premise infrastructure in addition to building a cloud base high performance grid infrastructure.

To meet these key considerations Garvoo proposed a Hyper Converged Infrastructure (HCI) in the cloud and on premise MOAXY solution for all its global locations.

Solution

Rather than building and managing their computing infrastructure and data centers, Griddable choose MOAXY appliance. With a subscription based model and no initial investments, the highly secure and robust infrastructure supports its application and enables it to synchronize data across multiple on-premise and hybrid clouds.

Garvoo's MOAXY (Mother of All proXYies) solution is designed to address this challenge. It provided an on premise solution in a single box to address:-

- > Managed Security by implementing DLP, phishing, malware & virus protection, managed firewall & UTM gateways (Unified Threat Management).
- > Secure Connectivity including enterprise/ cloud VPN, wifi, load balancing, SD WAN and visibility plus control of network traffic.
- > Access and authorization control using ACLs and policies.

“

While I managed a very complex IT infrastructure, I only had one number to call for support. It simplified my life.

VP of Engineering, Griddable (Acquired by Salesforce in 2019)

”

Benefits & Outcomes

The appliance is provided with subscription pricing, eliminating the need to procure & set up separate servers and licenses for managing these different aspects. Griddable realized the following benefits as a result of this:

- > Fully managed cloud IT environment with Zero CapEx
- > Deployed in hours, not days/weeks
- > Managed Security
- > Secure Connectivity
